

Hackathon Challenge: Optimise Your Student Life

Build something that makes student life smoother, smarter, or just plain easier!

Challenge

Your challenge is to design and build a solution that meaningfully improves student life, this could be saving time, reducing stress, improving decision-making or solving another problem students face.

We want you to focus on a real problem you or other students experience and create something practical that could ideally be used beyond the hackathon.

Examples

- Smart scheduling & time management
- Budgeting and subscription tracking
- Study optimisation and focus tools
- Transport, bus tracking, or navigating around campus

These are just some examples, feel free to do something completely different

What You Can Build

Any platform or technology is welcome:

- Web, mobile, or desktop apps
- Dashboards or analytics tools
- Browser extensions
- Automation systems or integrations
- Hardware / IoT prototypes
- Everything else!

If it solves a real student problem, it's fair game.

Judging Criteria

- **Impact:** How effectively does the solution improve student life?
- **Innovation:** Does the idea approach the problem in a novel or creative way?

- **Technical Difficulty:** How challenging and well-executed is the technical implementation?

This challenge is intentionally open-ended, build something useful, be creative, and show us how you would optimise your student life!
